

Website Analysis Report: JACOBI — 24-Agent Pricing Topology Probe

1. Executive Summary

JACOBI is an innovative platform dedicated to uncovering price discrimination within the travel and e-commerce industries. It employs a unique methodology involving 24 simulated user identities, each with distinct attributes such as geographical location, device type, and network configuration, to probe pricing variations. This approach, powered by residential proxies, provides users with concrete evidence of price markups, enabling them to identify and understand the factors influencing differential pricing.

2. Design and Visual Identity

2.1 Aesthetic Overview

The website exhibits a **modern, high-tech, and forensic aesthetic**, characterized by a dark theme with vibrant neon green accents. This color scheme evokes the visual style of a command-line interface or a sophisticated data analysis tool, aligning with the platform's technical nature. The typography, a blend of *JetBrains Mono*, *Inter*, *Space Grotesk*, and *Instrument Serif*, strikes a balance between technical precision and a refined, editorial feel. Visual elements are minimalist, focusing on clean lines, clear data presentation, and subtle animations, such as the dynamic display of pricing variations, which effectively communicates the platform's capabilities.

2.2 User Interface (UI)

The **User Interface (UI)** is designed for clarity and efficiency. The primary navigation is streamlined, featuring a top bar with links to "Probe," "History," "Board," and "Pricing," alongside the prominent "JACOBI" brand logo. The hero section immediately presents the core value proposition: "Run one URL through 24 versions of you," accompanied by a

clear call to action (CTA) in the form of a URL input field. The landing page employs a vertical scroll layout to logically present the platform's "Mechanism," showcase "Evidence" of its effectiveness, and guide users towards conversion.

3. User Experience (UX) and Content Strategy

3.1 Content Strategy

The content strategy is highly effective in conveying the platform's value. The core value proposition is articulated immediately, ensuring visitors quickly grasp the service's purpose. The inclusion of a compelling "UA182 / JFK → LHR" example serves as a powerful **proof of concept**, demonstrating the platform's utility without requiring immediate user interaction. This approach significantly enhances user engagement by illustrating tangible benefits upfront. Furthermore, the "Start Free" option on the pricing page is strategically placed to encourage user adoption and facilitate a smooth onboarding process.

3.2 Information Architecture

The information architecture is well-structured, guiding users through the platform's functionalities:

- **Probe Cockpit:** This serves as the central hub for user interaction, where new pricing probes are initiated.
 - **History/Logbook:** Provides users with a personalized record of their past probes, allowing for tracking and review of historical data.

4. Technical Analysis

4.1 Technology Stack

Based on observed elements and behaviors, the website appears to leverage a modern technology stack:

- **Frontend Framework:** Likely built with **Next.js**, indicated by the presence of `_next/static` in the file structure, suggesting a React-based server-rendered application.
- **Infrastructure:** Integrates with **Bright Data** for its residential proxy network, which is crucial for deploying the 24 synthetic shopper identities.
- **Payment Gateway:** Utilizes **Stripe** for payment processing, currently operating in "Test Mode" as indicated on the pricing page.

4.2 Accessibility and SEO

- **Search Engine Optimization (SEO):** The website incorporates descriptive meta tags and Open Graph (OG) tags, which are essential for improving search engine visibility and enhancing content sharing on social media platforms.
- **Accessibility:**
 - **Strengths:** The `lang="en"` attribute is correctly set on the `<html>` element, which is a fundamental accessibility practice.
 - **Weaknesses:** Opportunities exist for enhancing accessibility through the addition of ARIA labels to interactive elements and the implementation of landmark roles (e.g., `<main>`, `<nav>`) to improve navigation for users relying on screen readers.

4.3 Performance

The website demonstrates good initial loading speed. The platform transparently communicates that the actual "probe" process for free users takes approximately 60-90 seconds, effectively managing user expectations regarding the time required for data retrieval and analysis.

5. Recommendations for Improvement

1. **Accessibility Enhancements:** Implement ARIA labels for all interactive UI components and define appropriate landmark roles (e.g., `<main>`, `<nav>`, `<aside>`) to improve navigation and usability for assistive technologies.
 2. **Mobile Responsiveness:** Optimize the display of data-heavy tables, particularly in the “Leaderboard” and “Evidence” sections, to ensure full responsiveness across various mobile devices. This could involve implementing horizontal scrolling for tables or a stacked card layout on smaller screens.
 3. **User Engagement:** Consider adding a concise “How it Works” video or an animated demonstration to the hero section. This visual aid would effectively illustrate the complex 24-agent probing process, making it more accessible and engaging for new users.
 4. **Trust and Security:** Once the Stripe payment gateway is out of “Test Mode,” integrate trust badges, security certifications, or customer testimonials prominently on the pricing and checkout pages to build user confidence.
